
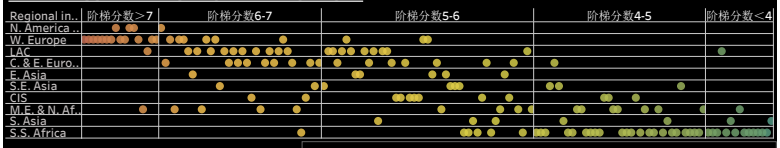
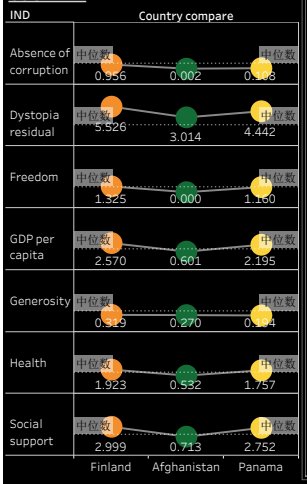
HAPPINESS RANKING FROM LEFT TO RIGHT

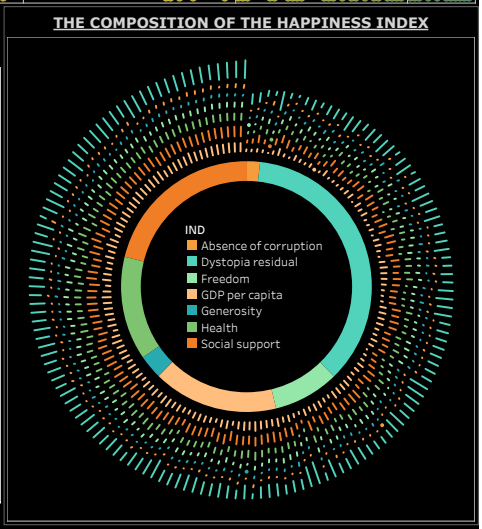


THE GAP BETWEEN DIFFERENT COUNTRY

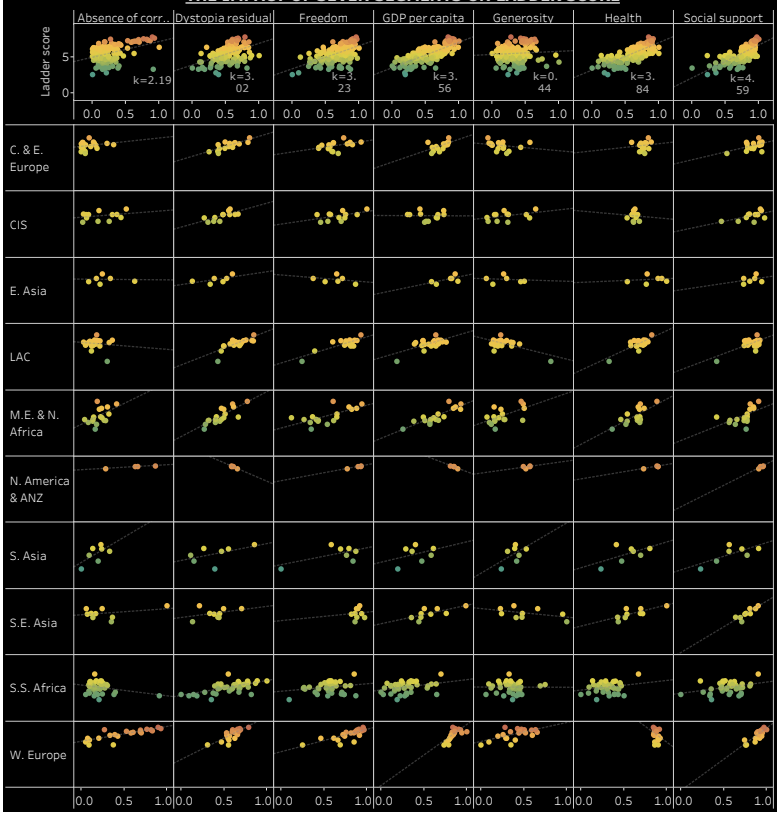
Panama



THE COMPOSITION OF THE HAPPINESS INDEX



· The report maily use six key variables to explain the full sample of national annual average scores . These variables are GDP per capita, social support, healthy life expectancy, freedom, generosity, and absence of corruption. The final one is the sum of two components: the calculated average 2017-2019 life evaluation in Dystopia (=1.97) and each country's own prediction error.
· You can select a country to see the scores of detailed variables and comparing with the No.1 country, Finland and the last one, Afghanistan.

· The overall length of each country bar above in the radial bar chart represents the average ladder score, and each bar is divided into seven segments. The first six sub-bars show how much each of the six key variables is calculated to contribute to the ladder score, relative to that in a hypothetical country called "Dystopia", so named because it has values equal to the world's lowest national averages for 2017-2019 for each of the six key variables. Dystopia is used as a benchmark against which to compare contributions from each of the six factors.
· From the scatter diagrams bellow show the ifluence of 7 factors on the ladder score. We can see that the scores of Social support has the biggest impact on ladder score, and the Generosity has the least impact. You can also find the difference between regions.


THE IMPACT OF SEVEN SEGMENTS ON LADDER SCORE
